

Exercise 8 - CAPL

1. Create a configuration using CANoe or CANalyzer that is able to (similar to Exercise 3 - CANalyzer/IG) :

- Observe and log CAN trace.
- See in graphs at least two signals of interested with samples

2. Insert a program node and write a CAPL that is able to

- Print the payload of a single received CAN message
- Send a CAN message with proper timings that is received by the ECU that you have connected to the cancase
- At start of measurement print "Started"
- At stop of measurement print "Stopped"
